Old Areas & Distances

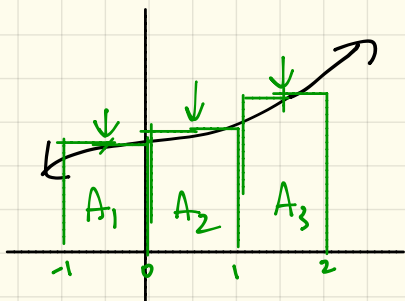

Let's consider the function $f(x) = x^3 + 2$. Approximate the area from $x = -1$ to $x = 2$ using 3 rectangles.

$$\Delta x = \frac{b-a}{n} = \frac{2-(-1)}{3} = \frac{3}{3} = 1$$

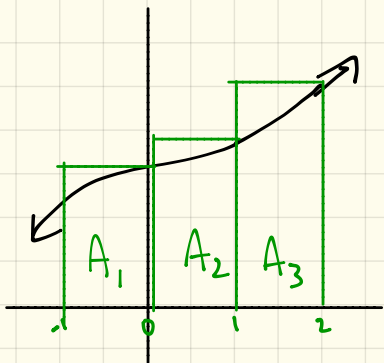

LRAM

$$\begin{aligned} \text{SUM} &= A_1 + A_2 + A_3 \\ &= \Delta x [f(-1) + f(0) + f(1)] \\ &= 1 [1 + 2 + 3] \\ &= \textcircled{6} \end{aligned}$$

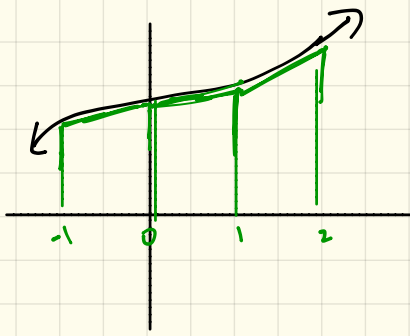

MRAM

$$\begin{aligned} \text{SUM} &= A_1 + A_2 + A_3 \\ &= \Delta x [f(-.5) + f(.5) + f(1.5)] \\ &= 1 [1.875 + 2.125 + 5.375] \\ &= \textcircled{9.375} \end{aligned}$$

RRAM

$$\begin{aligned} \text{SUM} &= A_1 + A_2 + A_3 \\ &= \Delta x [f(0) + f(1) + f(2)] \\ &= 1 (2 + 3 + 10) \\ &= \textcircled{15} \end{aligned}$$

Trapezoidal Rule Approx

$$\text{Sum} = A_1 + A_2 + A_3$$

$$= \Delta x [f(-1) + 2f(0) + 2f(1) + f(2)]$$

$$= 1 [1 + 2 + 3 + 10]$$

$$= \textcircled{16}$$

Also old Integration \rightarrow Antidifferentiation

$$\textcircled{1} \int x^5 + 3x^3 + \frac{2}{x^2} + \pi \, dx = \int x^5 + 3x^3 + 2x^{-2} + \pi \, dx$$

$$= \frac{x^6}{6} + \frac{3x^4}{4} + \frac{2x^{-1}}{-1} + \pi x + C$$

$$= \frac{1}{6}x^6 + \frac{3}{4}x^4 - \frac{2}{x} + \pi x + C$$

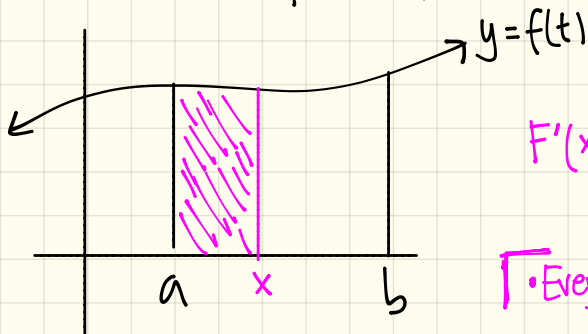

$$\textcircled{2} \int \frac{t^3 + 2t^2}{\sqrt{t^2}} \, dt = \int \frac{t^3}{\sqrt{t}} + \frac{2t^2}{\sqrt{t}} \, dt = \int \frac{t^3}{t^{1/2}} + \frac{2t^2}{t^{1/2}} \, dt$$

$$= \int t^{5/2} + 2t^{3/2} \, dt = \frac{t^{7/2}}{7/2} + \frac{2t^{5/2}}{5/2} + C$$

$$= \frac{2}{7}t^{7/2} + \frac{4}{5}t^{5/2} + C$$

[New] The FTC

Let's consider a function f continuous on $[a, b]$.

1st part of The FTC:

$$F'(x) = \frac{d}{dt} \int_a^x f(t) dt = f(x)$$

• Every continuous f has an antiderivative $F(x)$

$F(x) = \int_a^x f(t) dt$, where x is in $[a, b]$ • connection between differentiation & integration.

Definition

If f is continuous on $[a, b]$ then, $F(x) = \int_a^x f(t) dt$, $a \leq x \leq b$.
is continuous on $[a, b]$, differentiable on (a, b) & $F'(x) = f(x)$.

[Example] Find derivatives.

$$\textcircled{1} g(x) = \int_1^x (t^2 - 1)^{20} dt$$

$$g'(x) = \frac{d}{dx} \int_1^x (t^2 - 1)^{20} dt = (x^2 - 1)^{20}$$

$$\textcircled{2} f(x) = \int_{\pi}^x \frac{\cos^2 t}{\ln(t-\sqrt{t})} dt$$

$$f'(x) = \frac{d}{dx} \int_{\pi}^x \frac{\cos^2 t}{\ln(t-\sqrt{t})} dt = \frac{\cos^2 x}{\ln(x-\sqrt{x})}$$

Sometimes you might have to use the chain rule...

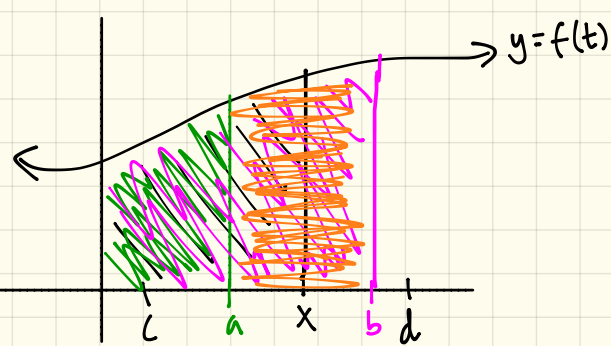

$$\textcircled{3} f(x) = \int_{\pi}^x \cot^2 t dt$$

$$f'(x) = \frac{d}{dx} \int_{\pi}^x \cot^2 t dt = \cot^2 x$$

$$\textcircled{4} h(x) = \int_{\pi}^{x^2} \cot^2 t dt$$

$$h'(x) = \frac{d}{dx} \int_{\pi}^{x^2} \cot^2 t dt = \cot^2(x^2) \cdot 2x = 2x \cot^2(x^2).$$

Let's consider a function f continuous on $[c, d]$.

1st part of FTC

$$F(x) = \int_c^x f(t) dt$$

$$F'(x) = f(x)$$

Let's think about what: (assuming $b > a$)

$$F(b) - F(a) = \int_c^b f(t) dt - \int_c^a f(t) dt = \int_a^b f(t) dt$$

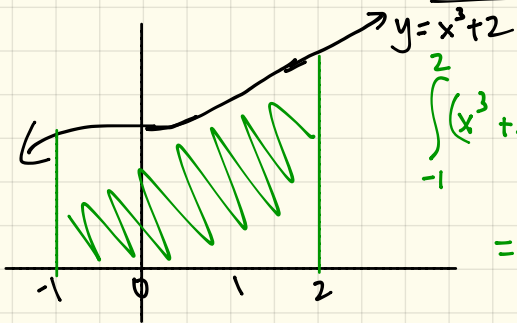

2nd part of FTC

$$\int_a^b f(x) dx = F(x) \Big|_a^b = F(b) - F(a) \text{ where } F' = f.$$

(so where F is the antiderivative of f)

[Example] - back to old example of Area & Distances

NOW WE ARE GOING TO COMPUTE the area.

$$\int_{-1}^2 (x^3 + 2) dx = \left[\frac{x^4}{4} + 2x \right]_{-1}^2$$

$$= \left[\frac{(2)^4}{4} + 2(2) \right] - \left[\frac{(-1)^4}{4} + 2(-1) \right]$$

$$= [8] - [-1.75]$$

$$= 9.75$$

$$\textcircled{2} \int_0^2 2 - x^2 dx = \left[2x - \frac{x^3}{3} \right]_0^2 = \left[2(2) - \frac{(2)^3}{3} \right] - \left[2(0) - \frac{(0)^3}{3} \right]$$

$$= \left[4 - \frac{8}{3} \right] - [0]$$

$$\approx 1.333$$

$$\textcircled{3} \int_2^5 2 + 3x - x^2 dx = \left[2x + \frac{3x^2}{2} - \frac{x^3}{3} \right]_2^5 =$$

$$= \left[2(5) + \frac{3(5)^2}{2} - \frac{(5)^3}{3} \right] - \left[2(2) + \frac{3(2)^2}{2} - \frac{(2)^3}{3} \right]$$

$$\approx 2.666$$
