

4.4 Systems of Circles Parabolas & Lines

old Systems of Linear Equations

Let's recall what system of equations means. Systems of Equations is a simultaneous set of lines (or curves) meeting at common point(s).

Let's consider the system of linear equations $\begin{cases} y = 2x + 1 \\ y = -2x - 3 \end{cases}$

What are the different methods one can use to solve systems of linear equations?

Let's use

① Graphing

② Substitution

③ Elimination

at least of the variable in one eqn must be solved for.

Solve for the common point using substitution method.

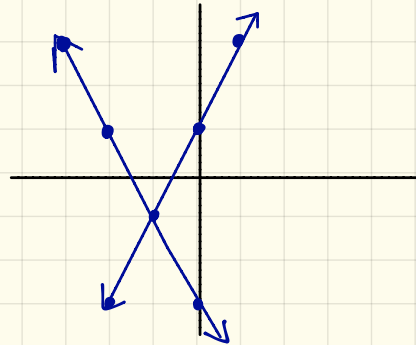

$$\begin{cases} y = 2x + 1 \\ y = -2x - 3 \end{cases}$$

$$\begin{array}{r} 2x + 1 = -2x - 3 \\ +2x \quad = +2x \\ \hline 4x + 1 = -3 \\ -1 \quad = -1 \\ \hline 4x = -4 \\ \frac{4x}{4} = \frac{-4}{4} \\ x = -1 \end{array}$$

get y : sub -1 for x

$$\begin{aligned} y &= 2(-1) + 1 \\ y &= -2 + 1 \\ y &= -1 \\ (-1, -1) \end{aligned}$$

Graph the 2 lines to show system & common point.

new System of Circles, Parabolas, and/or lines.

Let's consider the following graph:

Find the common points algebraically (Solve the system)

$$\begin{cases} x^2 + y^2 = 25 \\ y = 3x - 5 \end{cases}$$

$$\begin{aligned} x^2 + (3x - 5)^2 &= 25 \\ x^2 + (3x - 5)(3x - 5) &= 25 \\ x^2 + 9x^2 - 15x - 15x + 25 &= 25 \\ 10x^2 - 30x + 25 &= 25 \\ -25 &= -25 \end{aligned}$$

$$\begin{aligned} 10x^2 - 30x &= 0 \\ 10x(x - 3) &= 0 \\ x &= 0, 3 \end{aligned}$$

Find the y's:

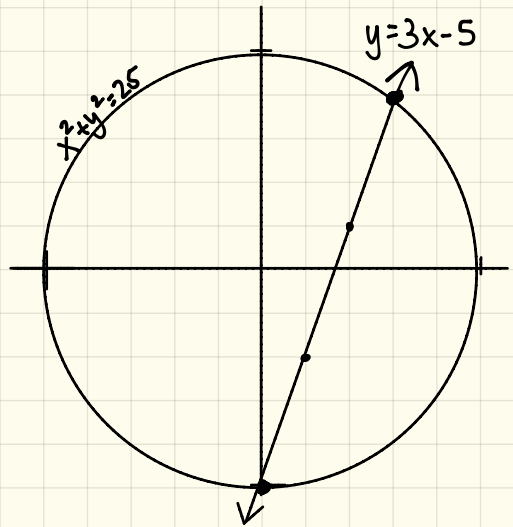

when $x=0$

$$\begin{aligned} y &= 3(0) - 5 \\ y &= -5 \end{aligned}$$

when $x=3$

$$\begin{aligned} y &= 3(3) - 5 \\ y &= 4 \end{aligned}$$

Common points are $(0, -5)$ and $(3, 4)$.

A circle & a line.

note: Use substitution method is usually the best & efficient method to use!

[Example 1] Solve the simultaneous equations $\begin{cases} x^2 + y^2 = 10 \\ y = x + 2 \end{cases}$.

(A circle & a line)

$$\begin{aligned} x^2 + y^2 &= 10 \\ y &= x + 2 \end{aligned}$$

Find y :

$$\begin{array}{ll} \text{when } x = -3 & \text{when } x = 1 \\ y = (-3) + 2 & y = (1) + 2 \\ y = -1 & y = 3 \end{array}$$

$$= (-3, -1) \text{ and } (1, 3)$$

$$\begin{aligned} x^2 + (x+2)^2 &= 10 \\ x^2 + (x+2)(x+2) &= 10 \\ x^2 + x^2 + 2x + 2x + 4 &= 10 \\ 2x^2 + 4x + 4 &= 10 \\ 2x^2 + 4x - 6 &= 0 \\ 2(x^2 + 2x - 3) &= 0 \\ 2(x+3)(x-1) &= 0 \\ x &= -3, x = 1 \end{aligned}$$

[Example 3] Solve the system when a parabola & line intersect

$$\begin{cases} y = x^2 + 4x - 1 \\ y = 7x + 9 \end{cases}$$

$$\begin{aligned} x^2 + 4x - 1 &= 7x + 9 \\ x^2 - 3x - 10 &= 0 \\ (x-5)(x+2) &= 0 \\ x &= 5, x = -2. \end{aligned}$$

Find y :

$$\begin{array}{ll} \text{when } x = 5 & \text{when } x = -2 \\ y = 7(5) + 9 & y = 7(-2) + 9 \\ = 44 & y = -5 \end{array}$$

Common points are $(5, 44)$ and $(-2, -5)$.
