# Old Parametric Equations

[Examples] Find the cartesian equation of the curve.

$$\textcircled{1} \quad x = 2t + 4, \quad y = t - 1$$

$$\Rightarrow \begin{aligned} y &= t - 1 \\ t &= y + 1 \end{aligned}$$

$$\Rightarrow \begin{aligned} x &= 2(y + 1) + 4 \\ &= 2y + 2 + 4 \\ &= 2y + 6. \end{aligned}$$

$$x = 2y + 6.$$

$$\textcircled{2} \quad x = \sqrt{t}, \quad y = 1 - t$$

$$\Rightarrow \begin{aligned} x &= \sqrt{t} \quad x \geq 0 \\ t &= x^2 \end{aligned}$$

$$\Rightarrow \begin{aligned} y &= 1 - (x^2) \\ y &= 1 - x^2. \end{aligned}$$

$$y = 1 - x^2, \quad x \geq 0$$

$$\textcircled{3} \quad x = e^t, \quad y = e^{-t}$$

$$\Rightarrow \begin{aligned} x &= e^t \\ \ln x &= t \quad x > 0 \end{aligned}$$

$$\Rightarrow \begin{aligned} y &= e^{-t} \\ &= e^{-(\ln x)} \\ &= e^{\ln x^{-1}} \\ &= x^{-1} \\ &= \frac{1}{x} \end{aligned}$$

$$y = \frac{1}{x} \quad x > 0.$$

[Examples] Describe the motion of a particle with position  $(x,y)$  as  $t$  varies in the given interval.

④  $x = 2\sin t$ ,  $y = 3\cos t$ ,  $0 \leq t \leq 2\pi$

$$\begin{aligned}\Rightarrow x &= 2\sin t \\ \frac{x}{2} &= \sin t \\ \left(\frac{x}{2}\right)^2 &= (\sin t)^2 \\ \frac{x^2}{4} &= \sin^2 t\end{aligned}$$

$$\begin{aligned}\Rightarrow y &= 3\cos t \\ \frac{y}{3} &= \cos t \\ \left(\frac{y}{3}\right)^2 &= (\cos t)^2 \\ \frac{y^2}{9} &= \cos^2 t\end{aligned}$$

$$\begin{aligned}\sin^2 t + \cos^2 t &= 1 \\ \frac{x^2}{4} + \frac{y^2}{9} &= 1\end{aligned}$$

$t$	$x$	$y$
0	0	3
$\frac{\pi}{6}$	1	$\frac{3\sqrt{3}}{2}$
$\frac{\pi}{4}$	$\sqrt{2}$	$\frac{3\sqrt{2}}{2}$
$\vdots$	$\vdots$	$\vdots$

$\therefore$  moving clockwise around an ellipse.

# [new] Tangents & Areas

## [Tangents]

Let's consider the parametric equations:  $x=f(t)$ ,  $y=g(t)$ .

When we eliminate the parameter to create one equation, we get

$$y = F(x) \\ g(x) = F(f(t)).$$

Now, let's differentiate this new parametric equations:  
(need chain rule to differentiate)

$$g(t) = F(f(t)) \\ \frac{d}{dt} g(t) = \frac{d}{dt} F(f(t))$$

$$g'(t) = F'(f(t)) \cdot f'(t) \\ = F'(x) f'(t)$$

Now, let's solve for  $F'(x)$ , assuming that  $(f'(t) \neq 0)$ :

$$g'(t) = F'(x) f'(t)$$

$$F'(x) = \frac{g'(t)}{f'(t)}.$$

This can be rewritten as  $F'(x) = \frac{\frac{dy}{dt}}{\frac{dx}{dt}}$  (provided that  $\frac{dx}{dt} \neq 0$ ).

[Examples] Find the slope of each point given.

①  $x = \sqrt{t}$ ,  $y = \frac{1}{4}(t^2 - 4)$  at  $t = 4$ .  $\left. \frac{dy}{dx} \right|_{t=4}$

$$x = t^{1/2}, y = \frac{1}{4}t^2 - 1$$

$$\frac{dy}{dx} = \frac{\frac{dy}{dt}}{\frac{dx}{dt}} = \frac{\frac{1}{4}(2)t^1}{\frac{1}{2}t^{-1/2}} = \frac{\frac{1}{2}t}{\frac{1}{2}t^{-1/2}} = t^{3/2} = \sqrt{t^3}$$

$$\left. \frac{dy}{dx} \right|_{t=4} = \sqrt{(4)^3} = \sqrt{64} = 8.$$

②  $x = \tan t$ ,  $y = \sin t$  at  $t = \frac{\pi}{4}$

$$\frac{dy}{dx} = \frac{\frac{dy}{dt}}{\frac{dx}{dt}} = \frac{\cos t}{\sec^2 t} = \frac{\cos t}{\frac{1}{\cos^2 t}} = \cos^3 t = (\cos t)^3$$

$$\left. \frac{dy}{dx} \right|_{t=\frac{\pi}{4}} = \left[ \cos\left(\frac{\pi}{4}\right) \right]^3 = \left( \frac{\sqrt{2}}{2} \right)^3 = \frac{2\sqrt{2}}{8} = \frac{\sqrt{2}}{4}.$$

Now, let's revisit the previous considered example with the goal of finding  $\frac{d^2y}{dx^2}$ .

$$\frac{d^2y}{dx^2} = \frac{d}{dx} \left( \frac{dy}{dx} \right) = \frac{\frac{d}{dt} \cdot \frac{dx}{dx}}{\frac{dx}{dt}}$$

[Example] Find  $\frac{d^2y}{dx^2}$  from each parametric equation.

①  $x = \tan t$ ,  $y = \sin t$ .

Remember:  $\frac{dy}{dt} = \cos t$ ,  $\frac{dx}{dt} = \sec^2 t$  and  $\frac{dy}{dx} = \cos^3 t$ .

$$\frac{d^2y}{dx^2} = \frac{\frac{d}{dt} \left( \frac{dy}{dx} \right)}{\frac{dx}{dt}} = \frac{\frac{d}{dt} (\cos^3 t)}{\sec^2 t} = \frac{3 \cos^2 t \cdot (-\sin t)}{\sec^2 t} = \frac{-3 \cos^2 t \sin t}{\sec^2 t}$$

$$= -3 \sin t \cos^4 t.$$

②  $x = \sqrt{t}$ ,  $y = \frac{1}{4}(t^2 - 4)$ ,  $t \geq 0$

Remember:  $\frac{dy}{dt} = \frac{1}{2}t$ ,  $\frac{dx}{dt} = \frac{1}{2}t^{-\frac{1}{2}}$ ,  $\frac{dy}{dx} = t^{\frac{3}{2}}$

$$\frac{d^2y}{dx^2} = \frac{\frac{d}{dt} \left( \frac{dy}{dx} \right)}{\frac{dx}{dt}} = \frac{\frac{d}{dt} (t^{\frac{3}{2}})}{\frac{1}{2}t^{-\frac{1}{2}}} = \frac{\frac{3}{2}t^{\frac{1}{2}}}{\frac{1}{2}t^{-\frac{1}{2}}} = 3t.$$

## [Areas]

Let's consider the parametric curve  $y = F(x)$ . Recall that  $x = f(t)$  and  $y = g(t)$ . Suppose we want to find the area between  $a$  and  $b$ .

$$y = F(x)$$

$$\text{Area} = \int_a^b F(x) dx = \int_a^b y dx = \int_a^b g(t) f'(t) dt. \quad (\text{Since } y = g(t) \text{ and } \frac{dx}{dt} = f'(t))$$

[Example 1] Find the area under the arch of a cycloid with the parametric equations  $x = r(1 - \sin\theta)$  and  $y = r(1 - \cos\theta)$ .

$$\begin{aligned} \text{Area} &= \int_0^{2\pi} y dx = \int_0^{2\pi} r(1 - \cos\theta) r(1 - \cos\theta) d\theta \\ &= r^2 \int_0^{2\pi} (1 - \cos\theta)(1 - \cos\theta) d\theta \\ &= r^2 \int_0^{2\pi} 1 - 2\cos\theta + \cos^2\theta d\theta \\ &= r^2 \int_0^{2\pi} 1 - 2\cos\theta + \frac{1}{2}(1 + \cos 2\theta) d\theta \\ &= r^2 \int_0^{2\pi} 1 - 2\cos\theta + \frac{1}{2} + \frac{1}{2}\cos 2\theta d\theta \\ &= r^2 \int_0^{2\pi} \frac{3}{2} - 2\cos\theta + \frac{1}{2}\cos 2\theta d\theta \\ &= r^2 \left[ \frac{3}{2}\theta - 2\sin\theta + \frac{1}{4}\sin 2\theta \right]_0^{2\pi} \\ &= r^2 [3\pi - 0] \\ &= 3\pi r^2 \end{aligned}$$
